

Rapid Application Development with Python and Ultra96

Author: Fred Kellerman
Avnet Ultra96 PYNQ Evangelist
DeveloperWeek June 2019 New York NY

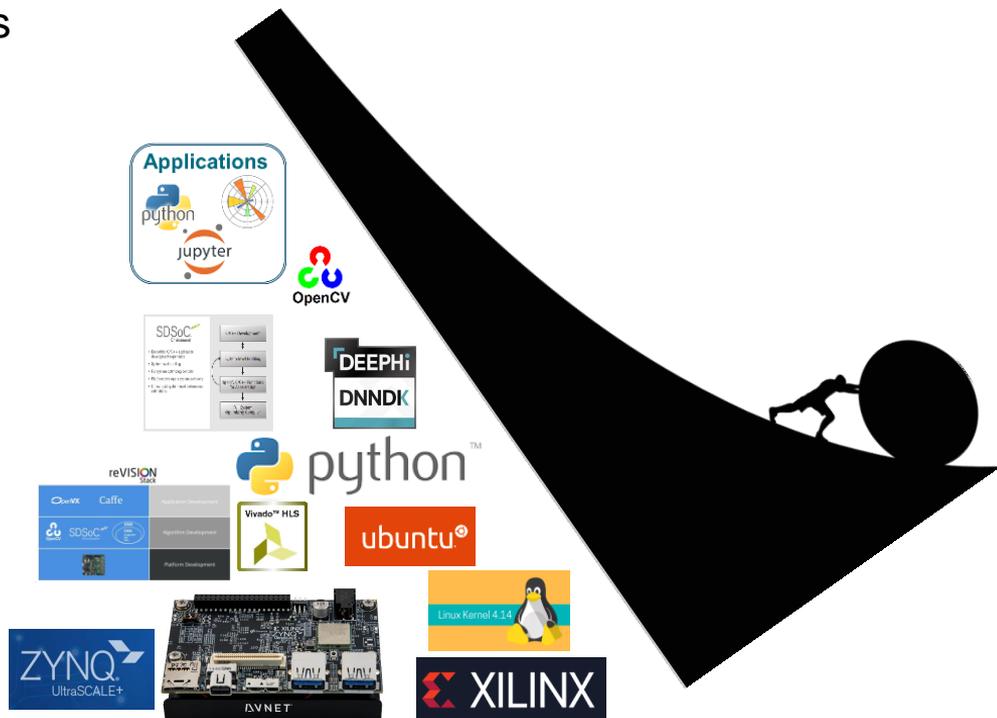

Overview

- Intro to Ultra96 board
- Up and running with PYNQ in minutes
- Jupyter Notebooks and Labs
- Intro to programmable hardware
- Programming hardware with software
- Interfacing Python with hardware
- Working example: Image Resizer

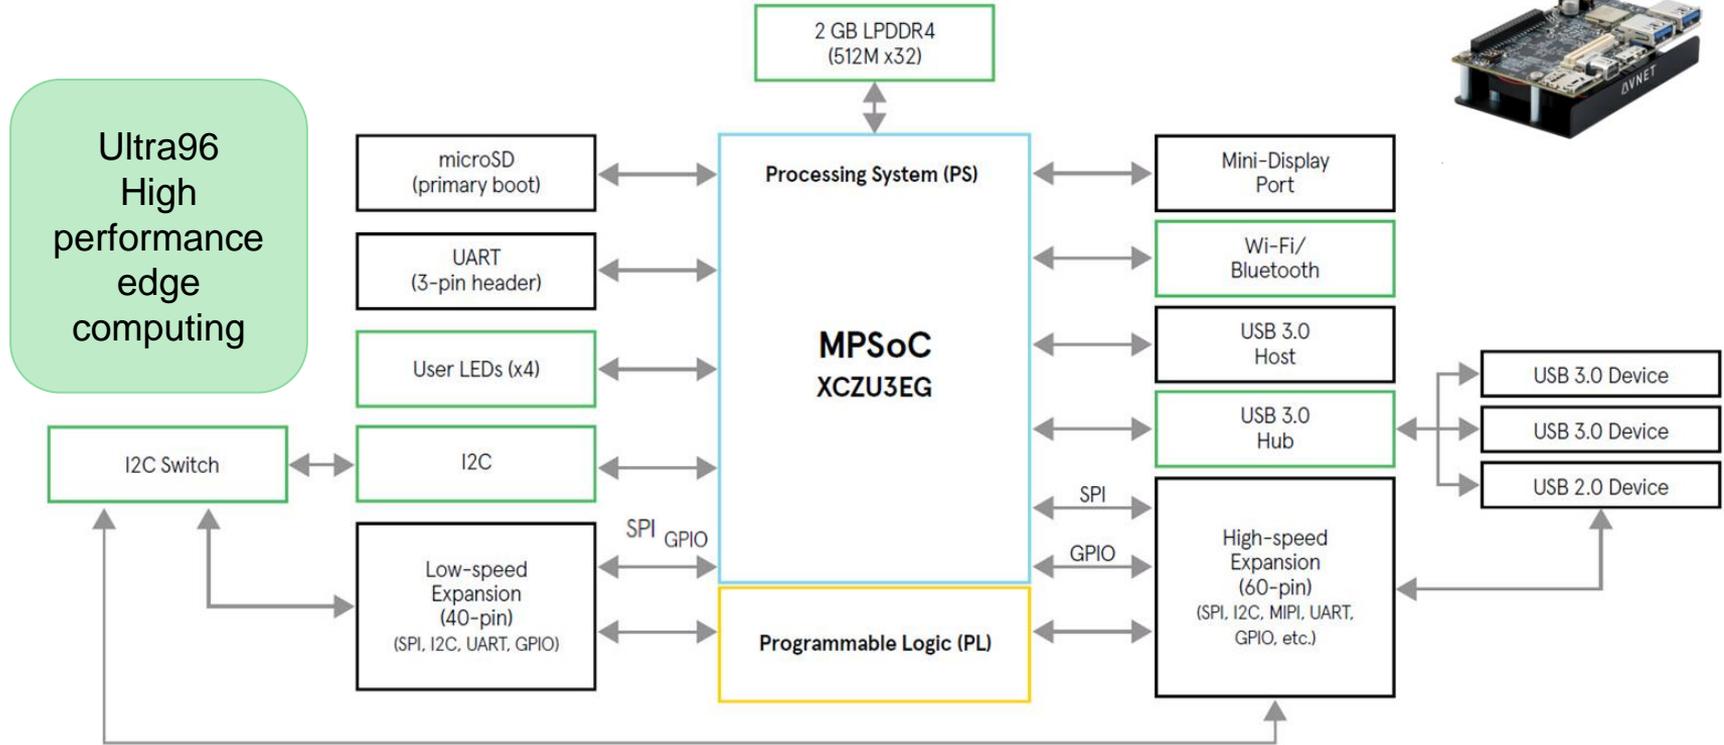

Python for ZYNQ™

PYNQ™

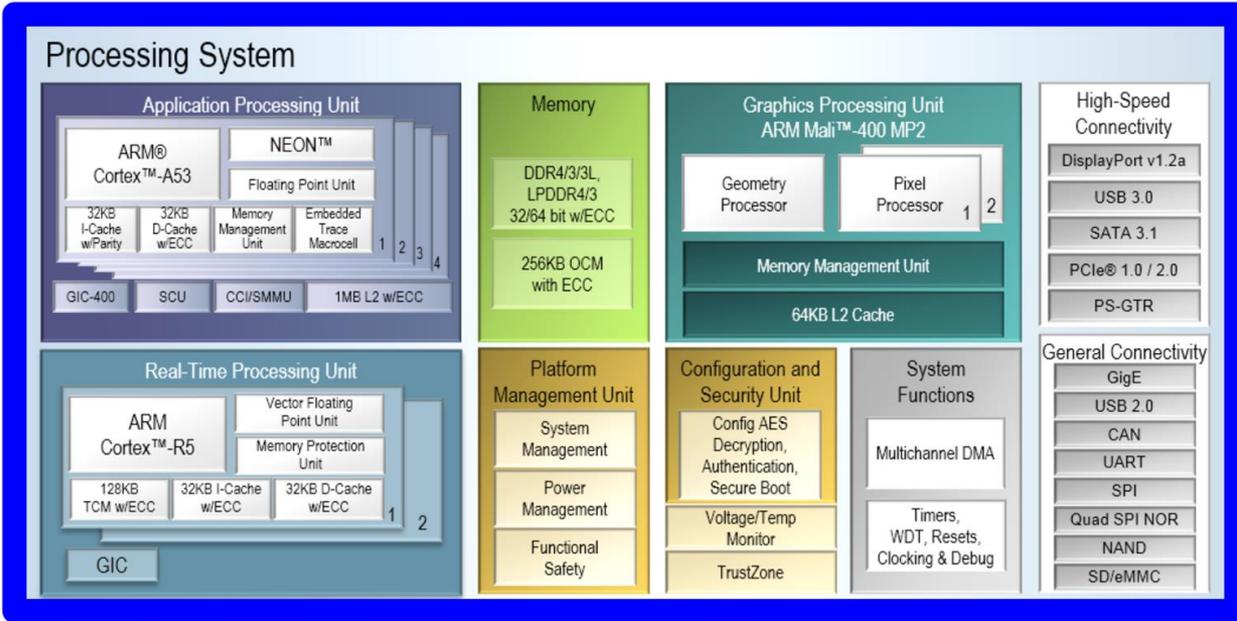

The board and the software

Ultra96 board features

- Linaro 96Boards Consumer Edition compatible
 - 85mm x 54mm form factor
- Obtain Ultra96 board from Avnet or affiliate

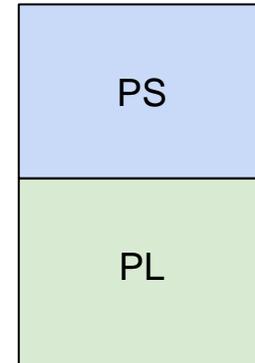

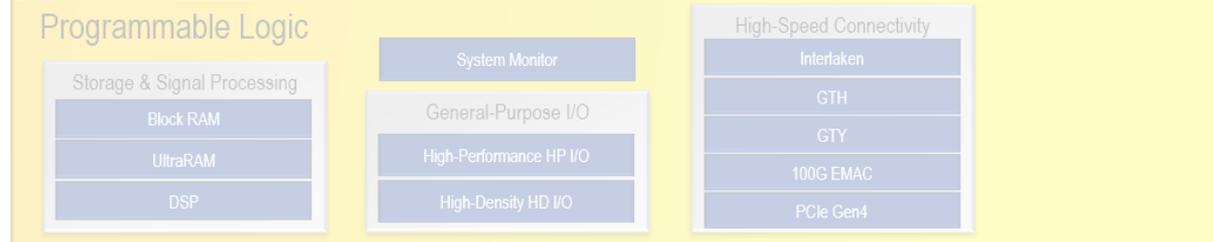

PS + PL = MPSoC Zynq

Ultra96's ZU3EG
ZYNQ UltraScale+ MPSoC

PS = Processing System

PL = Programmable Logic (FPGA)

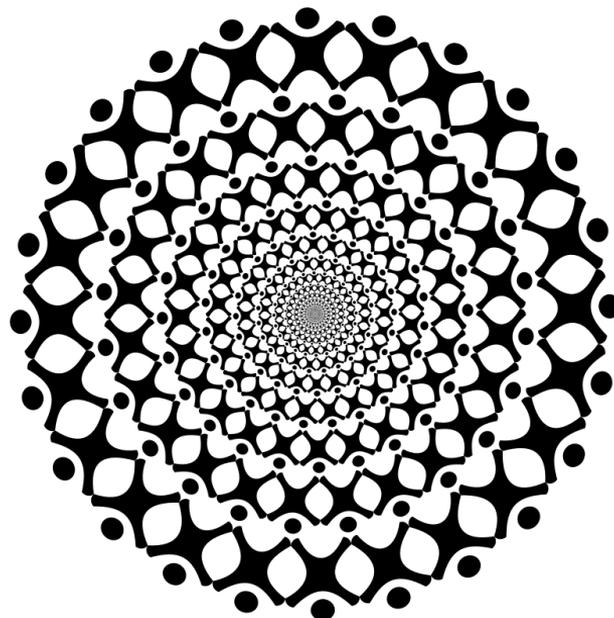

What is and who is PYNQ for?

- Python developers who want to use the capabilities of Ultra96 and Xilinx programmable hardware
- Developers who need an Open Source Linux based rapid prototyping environment
- Anyone who finds a Raspberry Pi or the like useful should consider PYNQ for Ultra96

The PYNQ framework provides:

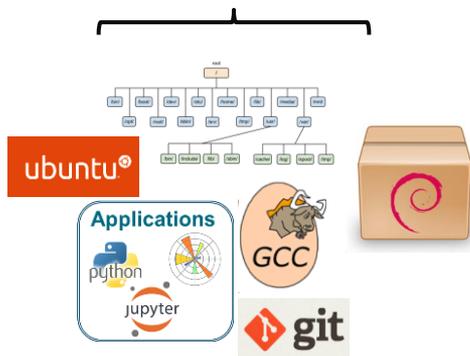

- Built-in design presentation and interaction
- Access and reuse of the Open Source universe
- Internet and IoT interaction and connectivity
- Machine learning
- Parallel hardware access from Python
- Video processing
- Hardware accelerated algorithms
- Real-time signal processing
- High bandwidth IO
- Low latency control
- And much much more....

What is Ultra96 PYNQ v2.4 made of?

It is a union of 3 major Open Source pieces that turn the Ultra96 into a complete Linux based distribution, palm of your hand computing system:

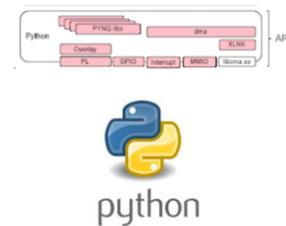

Ubuntu Bionic aarch64 Root FS
with **Python 3.6**

2018.3 Xilinx aarch64
PetaLinux

Xilinx PYNQ Python
module and classes

+ 100's more onboard + 1000's more available on the fly through "apt"

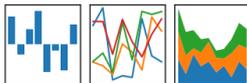

Debian Package Manager

v2.4 PYNQ works with Xilinx 2018.3 tool versions only!

Use powerful Python toolboxes

pandas

$$y_{it} = \beta' x_{it} + \mu_i + \epsilon_{it}$$

matplotlib

SciPy

NumPy

plotly

pillow

Twisted Matrix Labs
Building the engine of your Internet

Jupyter Notebook user web browser interface

Cell Types:

- Python code
- Markdown (Github)
- iPython input and output

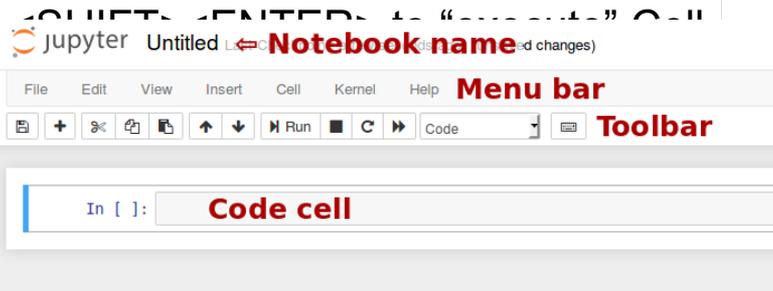

The screenshot shows a Jupyter Notebook interface with the following content:

- Header: jupyter Ring_LED_Click Last Checkpoint: 12 hours ago (unsaved changes)
- Menu bar: File, Edit, View, Insert, Cell, Kernel, Widgets, Help
- Toolbar: Run, Stop, Refresh, Undo, Redo, Home, End, Code
- Text: Blink some Mikro Elektronika lights with PYNQ and Ultra96 Pre-requisite: "sudo pip3 install spidev"
- Code cell (In [1]):

```
from pynq import GPIO
import time
import spidev
from future import print_function
from ipywidgets import interact, interactive, fixed, interact_manual
import ipywidgets as widgets
from threading import Thread
```
- Text: This will manipulate a LED Ring R Click Board in Slot 1 of the Ultra96 mikro click mezzanine board
- Text: Obtain the reset pin of slot 1 of the Ultra96 mikro mezzanine board Linux pin number to Xilinx pin numbers are offset and have a large base number that can change between different releases of Linux The pynq.get_gpio_base() will help here!
- Code cell (In [2]):

```
mio_linux_number = GPIO.get_gpio_base() + 37
rst_pin = GPIO(mio_linux_number, 'out')
```

This close-up shows the top part of the Jupyter Notebook interface:

- Header: jupyter Untitled Notebook name (unsaved changes)
- Menu bar: File, Edit, View, Insert, Cell, Kernel, Help
- Toolbar: Run, Stop, Refresh, Undo, Redo, Home, End, Code
- Code cell (In []): Code cell

Recommended browsers:

- Firefox, Chrome and Safari

Markdown support for Math Equations LaTeX:

An Identity of Ramanujan

Source

```
\begin{equation*}
\frac{1}{\sqrt{\phi\sqrt{5}-\phi}} e^{\frac{1}{5}\pi} = 1 + \frac{e^{-2\pi}}{1 + \frac{e^{-4\pi}}{1 + \frac{e^{-6\pi}}{1 + \frac{e^{-8\pi}}{1 + \dots}}}}
\end{equation*}
```

Display

$$\frac{1}{(\sqrt{\phi\sqrt{5}-\phi})e^{\frac{1}{5}\pi}} = 1 + \frac{e^{-2\pi}}{1 + \frac{e^{-4\pi}}{1 + \frac{e^{-6\pi}}{1 + \frac{e^{-8\pi}}{1 + \dots}}}}$$

Getting started: required parts

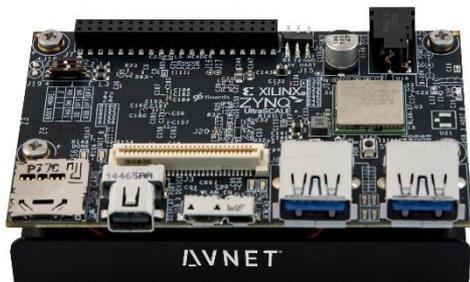

For Ultra96 V1:

<http://avnet.me/ultra96-pynq-image-v2.4>

For Ultra96 V2:

http://avnet.me/ultra96-pynq-image-v2.4_v2

(1.5GB download)

USB 2 (or 3)

\geq 16GB

Delkin, Sandisk, others?
Samsung EVO won't work

Host PC, Laptop:
Windows 10 (or 7),
Linux, OSX,
Chromebook

ubuntu®

(or Win32DiskImager)

240-100VAC 50/60Hz 12VDC 4A

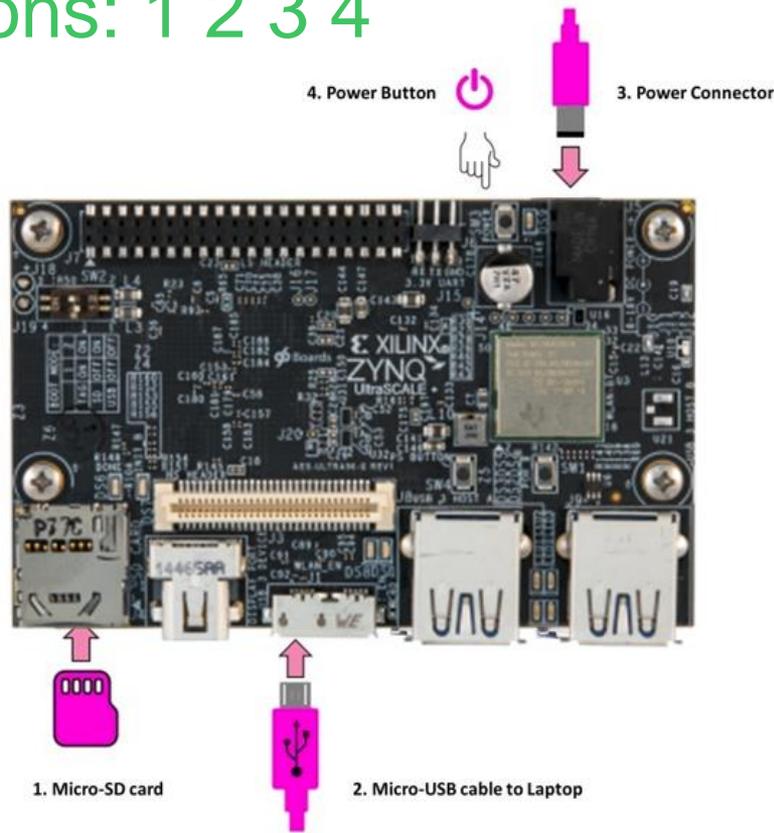

AES-ACC-U96-4APWR

AVNET®

Simple assembly instructions: 1 2 3 4

Please disconnect power supply from Ultra96:

1. Download ultra96_v2.4.zip, extract Ultra96_v2.4.img
 - a. Copy .img to micro SD card with Etcher.
 - b. Insert SD card in Ultra96
2. Connect USB cable between Ultra96 and host PC (Windows 7/10, Linux, MAC)
3. Attach power supply and plug-in
4. Press Ultra96 power on button

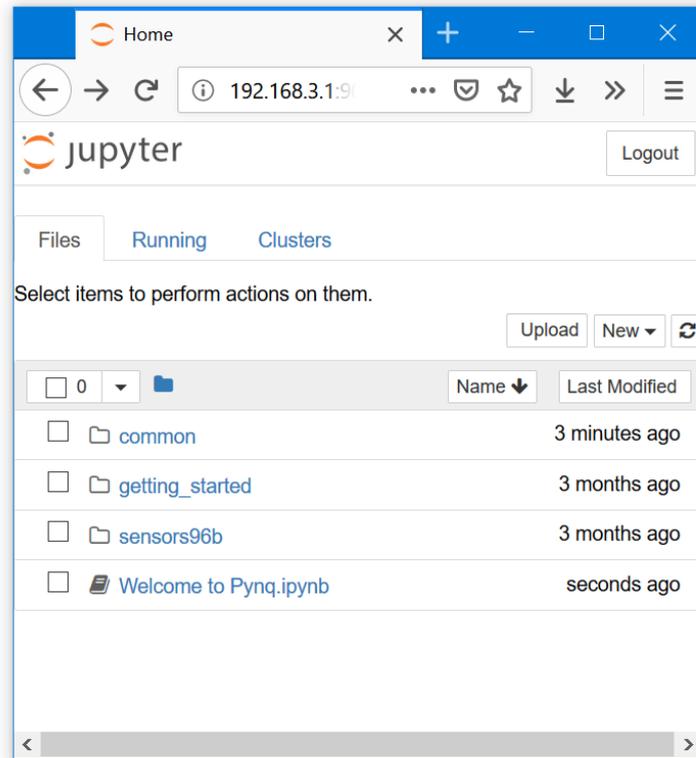

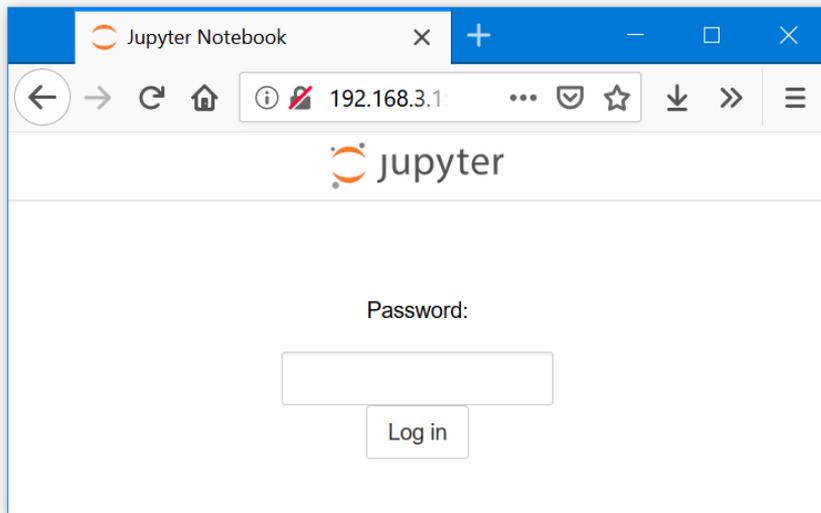

USB Cable to PC provides: Serial Console and 192.168.3.1 RNDIS + SAMBA share (xilinx)

Lights, web-browser: Jupyter Notebook Action

On your host PC direct your web-browser to:

http://192.168.3.1

The password is: **xilinx**

See Appendix for tips on knowing if initial install is working properly!

Example Python Jupyter Notebooks included:

- Welcome to Pynq
- Connect to WLAN with Ultra96 WiFi
- Intro to Jupyter Notebooks
- PL Overlay Download
- Random Numbers
- Execute shell cmds from Python
- USB Camera capture / OpenCV
- Change PL SoC clocks from Python
- Python and PYNQ
- Advanced Jupyter Notebooks
- Grove mezzanine sensor demos

USB Webcam

This notebook shows how to use a USB web camera attached to the board. An image is captured using [fsw webcam](#). The image can then be manipulated using the Python Image Library (Pillow).

The webcam used is the Logitech USB HD Webcam C270 and the driver for this webcam has already been installed on the board.

Jupyter Labs: a development IDE in your browser

In your browser go to:
<http://192.168.3.1/lab>

(You can also ssh, user: xilinx, pass: xilinx)

```
xilinx@xilinx:~$ ssh xilinx@192.168.3.1
xilinx@192.168.3.1's password:
Welcome to PYNQ Linux, based on Ubuntu 18.04 (GNU/Linux 4.14.0-xilinx-v2018.2 aarch64)

Last login: Thu Jan 31 03:15:48 2019 from 192.168.3.110
Last login: Thu Jan 31 03:15:48 2019 from 192.168.3.110
xilinx@pynq:~$ sudo apt install firefox
```

Note: The image shown at left has had additional applications installed. Out of the box you will only have the example Jupyter Notebooks installed.

Jupyter Labs is written in JavaScript use Chrome or Firefox for best results. Yes there is a GUI debugger add-on available through a Python module from IBM: PixiDust

The screenshot displays a Jupyter Lab environment with three main panels:

- Left Panel (Terminal):** Shows the installation of Firefox on the PYNQ Linux system.
- Center Panel (Code Editor):** Contains Python code for image detection using Darknet. The code includes:
 - 6. Draw detection boxes using Darknet: A function that uses Darknet to detect objects in an image and return their bounding boxes.
 - 7. Show the result: A function that displays the original image with detected objects (a bicycle, a car, and a dog) and their bounding boxes.
- Right Panel (Hardware Accelerator Simulation):** Shows a Verilog simulation of a hardware accelerator. It includes:
 - Code for the accelerator logic, including inference and buffer management.
 - A diagram of the accelerator's state machine (FSM) with states S0/000, S1/001, S2/011, S3/010, S4/110, and S5/111.
 - A waveform showing the output bits (direction, bit2, bit1, bit0) over time.
 - A table verifying the trace output against the expected Gray code count sequence.

© Copyright 2018 Xilinx

Software-style Packaging & Distribution of Designs

The image displays four screenshots from the Xilinx IDE, illustrating various design projects and their components:

- QNN MD PINQ:** Shows a search for "QNN MD PINQ / notebooks / developer/imagenet-samples.ipynb". It includes a code snippet for image classification and a photo of a dog.
- SPYN - III phase AC motor control:** Shows a search for "SPYN / notebooks / spyn.ipynb". It includes a title "SPYN - III phase AC motor control" and a list of objectives such as "Access to Motor Control Parameters" and "Download the ESDP bitstream".
- PINQ DL:** Shows a search for "PINQ DL / notebooks / resize.ipynb". It includes a title "Resizing an image" and a hardware diagram showing the connection between PS (ARM), PL (Resize IP), and DRAM (AXI_HP_0).
- PINQ ComputerVision:** Shows a search for "PINQ ComputerVision / notebooks / computer_vision / filter2d_and_dilate.ipynb". It includes a title "OpenCV Overlay: Filter2D and Dilate" and a code snippet for image processing.

Install designs = Jupyter Notebook, Python, overlay/bitstream + support files from GitHub with a single shell command, example OpenCV demo cmd:

```
sudo pip3 install git+https://github.com/Xilinx/PYNQ-ComputerVision.git  
(Ultra96 must have internet access, see appendix)
```

File	Description	Last commit
applicationCode	Added python script to run all unit tests.	a month ago
boards	Updated notebooks to use Overlay class.	2 months ago
components	Added static asserts, build python script and python test scripts.	a month ago
frameworks	fixing medianBlur upgrade to 2.18.2	a month ago
overlays	Update buildUnitOverlays.py	20 days ago
pynq_cv	Added back missing pynq_cv folder.	4 months ago
LICENSE	Updated license	2 months ago
README.md	Update README.md	2 months ago
block_diagram.png	update repo folder structure	5 months ago
setup.py	Added overlays and support for Pynq-Z1 v2.3.	4 months ago

README.md

PYNQ - Computer Vision

All PYNQ releases ship with the popular [OpenCV](#) library pre-installed. The PYNQ computer vision overlays enable accelerating OpenCV components in Programmable Logic (PL). These overlays expose a subset Xilinx' [xfOpenCV](#) library (a part of Xilinx' [reVISION solution](#)) at the Python level, combined with the support for HDMI input/output (Pynq-Z1 and Pynq-Z2 only). Webcam, stream or file based input/output remains available through the pre-installed SW OpenCV (on all Pynq boards).

Currently this package is compatible with [PYNQ image v2.3](#).

Look here to see if Ultra96 is supported, not all notebooks have a board folder

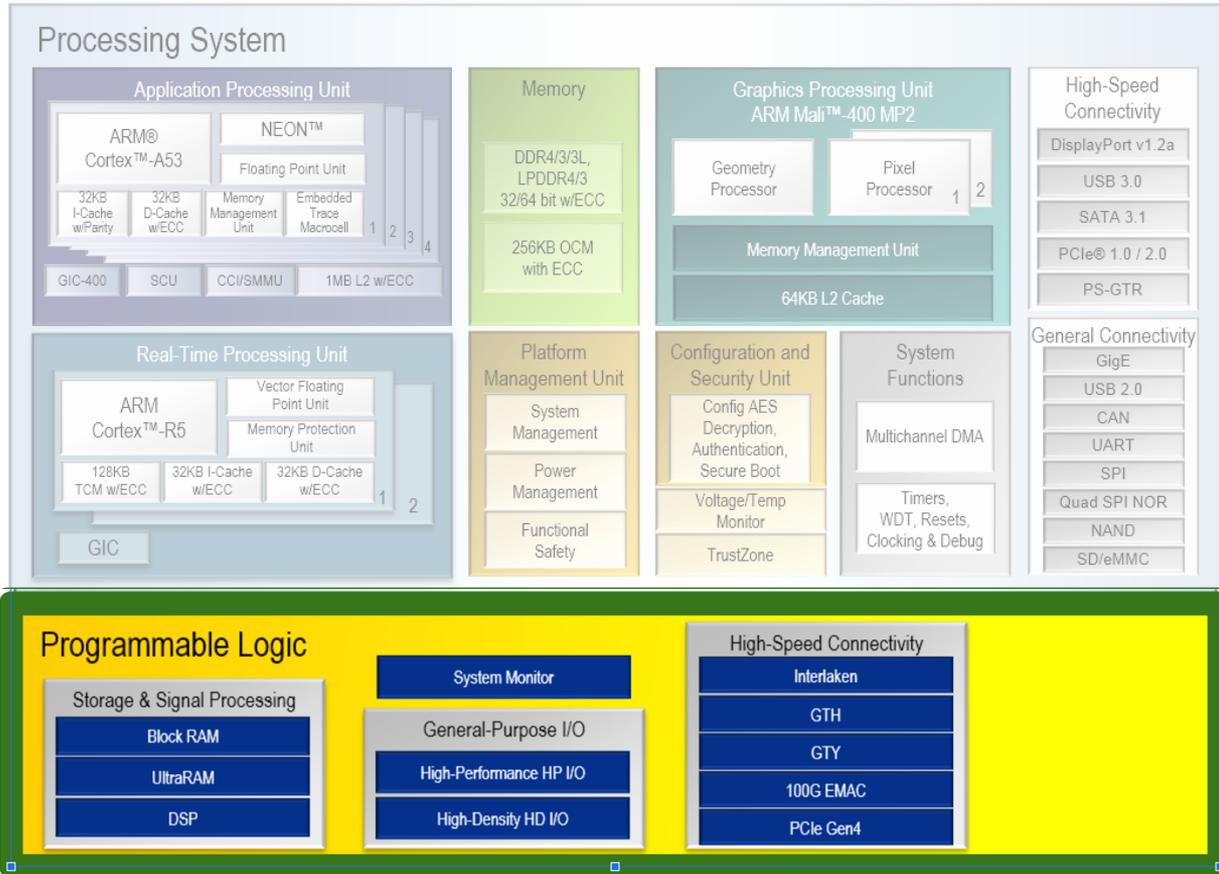

Branch: master PYNQ-ComputerVision / boards /

..	
Pynq-Z1	Updated readme info.
Pynq-Z2	Updated notebook text.
Ultra96	Updated notebooks to use Overlay class.
ZCU104	update repo folder structure

Double check PYNQ version as well!

Through the Looking Glass: Programmable Hardware with Python

PS + PL = MPSoC Zynq

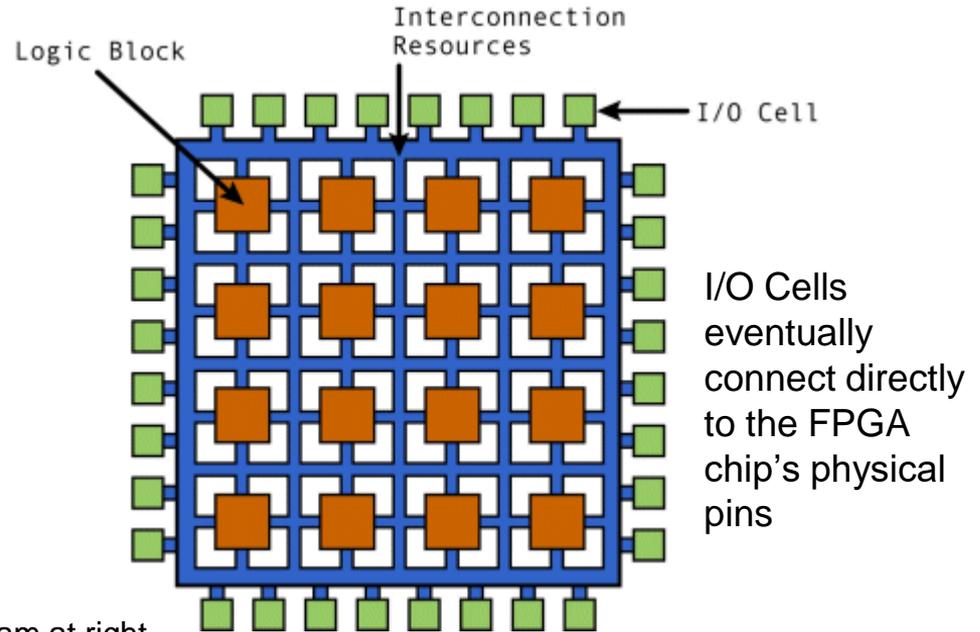

Ultra96's ZU3EG ZYNQ UltraScale+ MPSoC

PS = Processing System

PL = Programmable Logic

Note: ZU3EG does not have UltraRAM or High-Speed Connectivity.

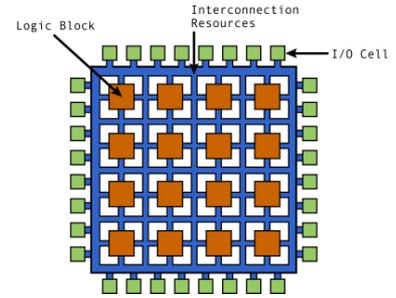

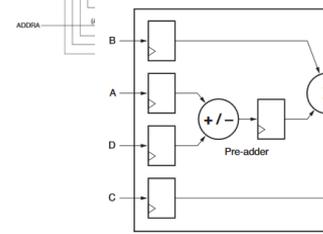

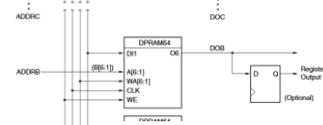

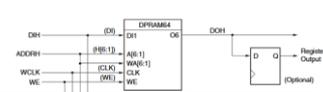

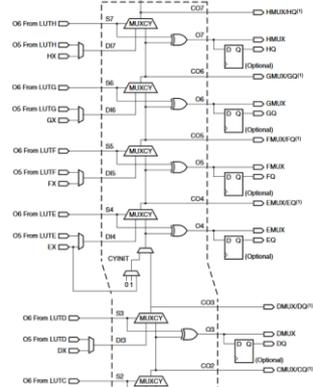

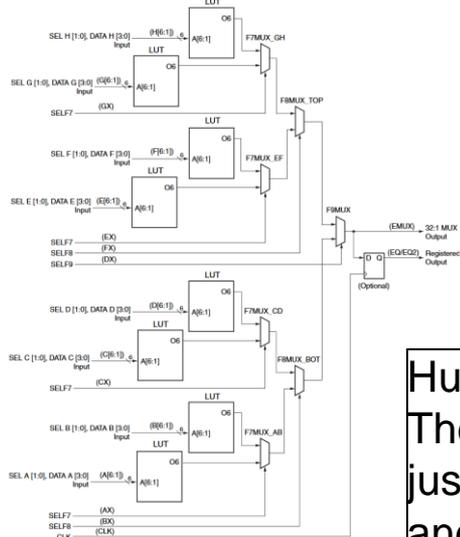

PL/Field Programmable Gate Array, under the hood:

(The diagram at right is a simplification of what is inside the actual part!)

What's inside?

LUTs, Clocks, PLLs, Transceivers, Multiplexers, modulo 2 based Logic Functions, Interconnects, Arithmetic operators and Memories

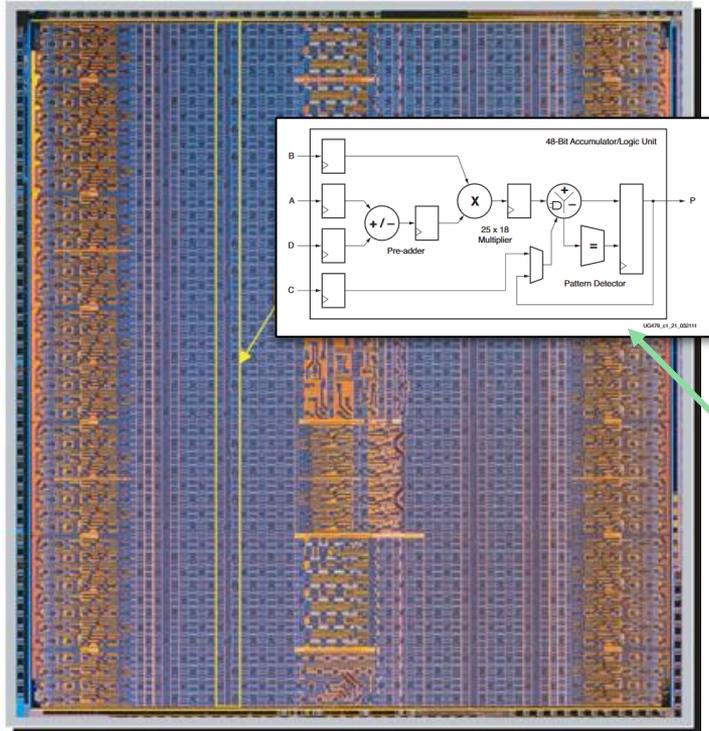

Hundreds of thousands of these programmable logic block widgets! They can be interconnected to create logic that can accomplish just about anything. Hardware Design Language source is synthesized and then place and routed (the tools do this for you). This is analogous to a compiler and linker.

Note: logic in ZU3eG is not exactly exactly as shown above but is similar

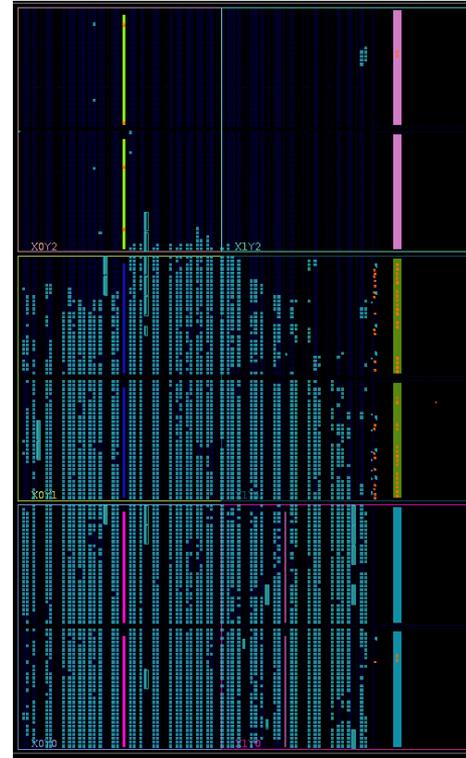

PL/FPGA innards

Raw chip die:
(not actual ZU3EG)

(360 parallel
48-bit MAC
accelerators
in the
ZU3EG)

Compiler (synthesis)
place and route output:

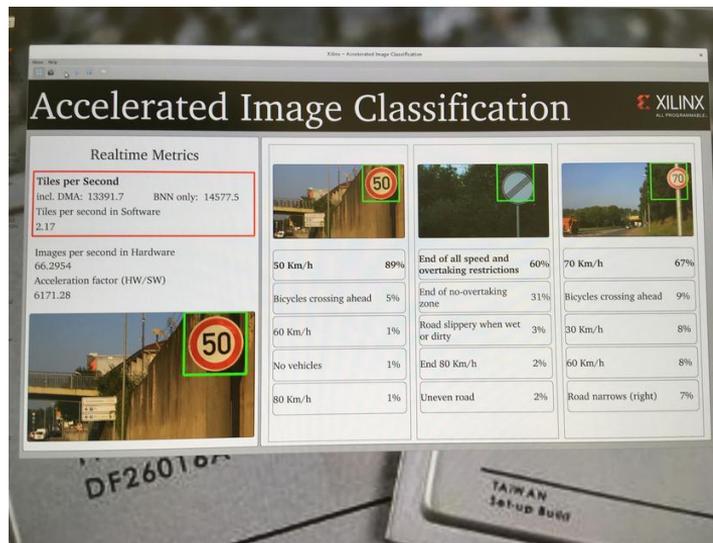

Reasons to use a PL/FPGA

- For many solutions the PL will be orders of magnitude faster
- Precise timing capabilities (picoseconds jitter accuracy) for control of hardware
- Determinism of algorithmic execution (no cache, preemption, task switching, threads or interrupts if you design it that way)
- You can do things beyond what the PS can do with Python, even design your own CPU/GPU! See Xilinx's MicroBlaze™ for PYNQ:
https://pynq.readthedocs.io/en/v2.0/pynq_libraries/pynq_microblaze_subsystem.html
- The art of designing hardware with software can be rewarding and enjoyable!

Example - machine learning computer vision on Ultra96:

- FINN Binary Neural Network (BNN) non-PYNQ demo
- <http://www.wiki.xilinx.com/Zynq+UltraScale%EF%BC%8B+MPSoC+Accelerated+Image+Classification+via+Binary+Neural+Network+TechTip>

1080p Images per Second in HW: 66.3

1080p Images per Second in *SW: .01

HW Acceleration Factor: *6171

* The SW used for benchmark was running on the Ultra96 ARM Cortex™ A53 cores with same OS as the HW tests @ ~1.3GHz. Other platforms that have somewhat faster ARM cores could do a little better with just SW. Other platforms with their own hardware accelerators will also run faster than pure SW.

Ultra96 FINN PYNQ Notebook:

<https://github.com/Xilinx/BNN-PYNQ.git>

Traditional cpu based programming

CPU programming is sequentially executed

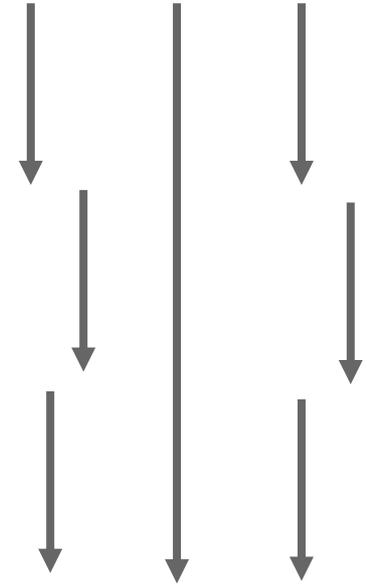

Sure we have interrupts and soft processes and threads
(virtual parallelism)

And hardware threads and processes and multiple cores/CPU's
(true parallelism)

Interprocess communications are sequential execution strands
ordered through some kind of semaphore for synchronization.

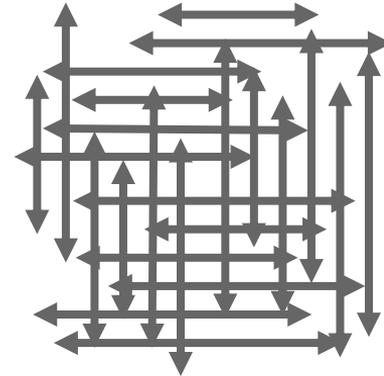

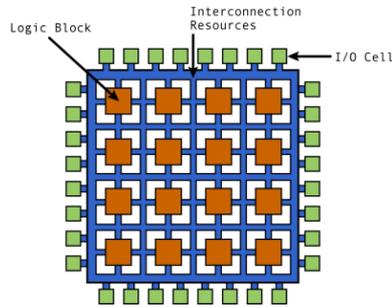

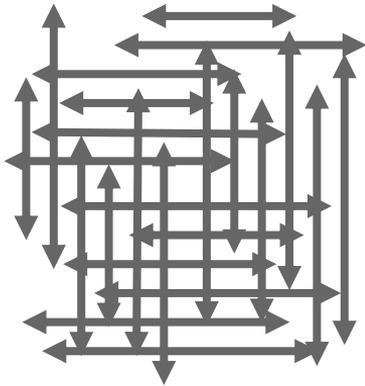

Some parallelism to exploit and cope with for CPUs? Yes A relative lot? No

Easy to create and comprehend, can read top to bottom and follow the code...

Parallel hardware programming mindshift

- Hardware “executes” all at once: extreme parallelism
 - What could you do with 360 multipliers simultaneously?
- “Interprocess communication” occurs at the speed of electrical signal propagation (which still gets in the way even at near the speed of light)
- Programmed with Hardware Design Languages (HDL): VHDL, Verilog

VHDL 4-bit decimal up counter example

```
library IEEE;
use IEEE.STD_LOGIC_1164.ALL;
use IEEE.STD_LOGIC_ARITH.ALL;
use IEEE.STD_LOGIC_UNSIGNED.ALL;

entity bin_counter_A is
  port(
    enable: in std_logic;
    clk: in std_logic;
    reset: in std_logic;
    output: out std_logic_vector(0 to 3));
end bin_counter_A;

architecture behavioral of bin_counter_A is
  signal count: std_logic_vector(0 to 3);
begin  process(enable, clk, reset)
  begin
    if reset='1' then
      count <= "0000";
    elsif(rising_edge(clk)) then
      if enable='0' then
        if count="1001" then
          count <= "0000";
        else
          count <= count + 1;
        end if;
      end if;
    end if;
  end process;
output <= count;
end behavioral;
```

Both programs give the same results, lines of code are not time ordered top to bottom !?!

```
library IEEE;
use IEEE.STD_LOGIC_1164.ALL;
use IEEE.STD_LOGIC_ARITH.ALL;
use IEEE.STD_LOGIC_UNSIGNED.ALL;

entity bin_counter_B is
  port(
    enable: in std_logic;
    clk: in std_logic;
    reset: in std_logic;
    output: out std_logic_vector(0 to 3));
end bin_counter_B;

architecture behavioral of bin_counter_B is
  signal count: std_logic_vector(0 to 3);
begin  process(enable, clk, reset)
  begin
output <= count;
    if reset='1' then
      count <= "0000";
    elsif(rising_edge(clk)) then
      if enable='0' then
        if count="1001" then
          count <= "0000";
        else
          count <= count + 1;
        end if;
      end if;
    end if;
  end process;
end behavioral;
```

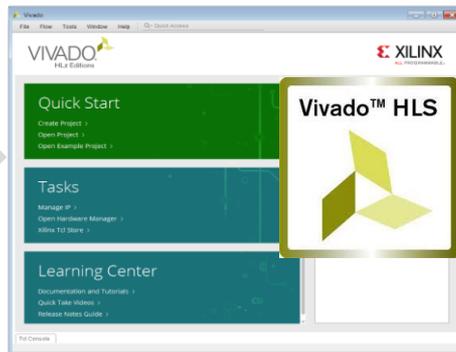

Xilinx tools for software programmers to the rescue

Don't have the time for the learning curve of HDL?

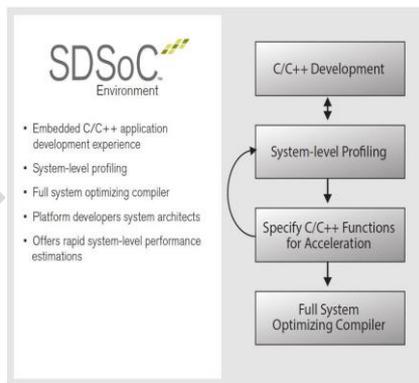

Then program PL hardware with

C/C++ using Xilinx HLS or SDSoC

C/C++/OpenCL

PL Overlay/
bitstream

C/C++/OpenCL

(also requires
Device Support
Archive file, .dsa)

PL bitstream +
.exe, .so

Note: Overlay/bitstream
is a file that configures
the PL hardware

HLS/SDSoC hardware design

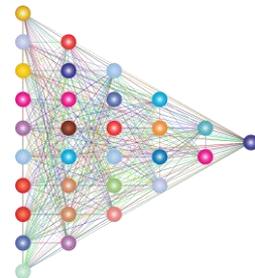

- Excellent fit for accelerator type architecture, also very good for other hardware-isms
- Some paradigms cannot be exploited (can intermix with HDL to overcome)
- Programmer is still responsible for exploitation of parallelism but to a lesser degree
- `#pragma` are used to tell compiler how to synthesize your code

HLS Sobel Edge Detector fragment:

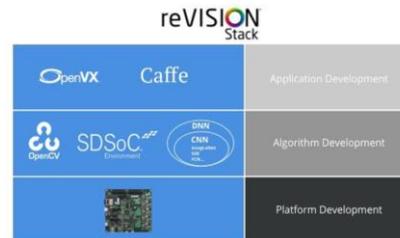

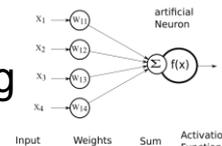

```
for(i = 0; i < height; i++){
    for(j = 0; j < width; j++){
        x_dir = 0;
        y_dir = 0;
        if((i > 0) && (i < (height-1)) && (j > 0) && (j < (width-1))){
            for(rowOffset = -1; rowOffset <= 1; rowOffset++){
                for(colOffset = -1; colOffset <= 1; colOffset++){
                    x_dir = x_dir + input_image[i+rowOffset][j+colOffset] * Gx[1+rowOffset][1+colOffset];
                    y_dir = y_dir + input_image[i+rowOffset][j+colOffset] * Gy[1+rowOffset][1+colOffset];
                }
            }
            edge_weight = ABS(x_dir) + ABS(y_dir);
            output_image[i][j] = edge_weight;
        }
    }
}
```

```
for(i = 0; i < height; i++){
    for(j = 0; j < width; j++){
        #pragma HLS PIPELINE
        x_dir = 0;
        y_dir = 0;
        if((i > 0) && (i < (height-1)) && (j > 0) && (j < (width-1))){
            for(rowOffset = -1; rowOffset <= 1; rowOffset++){
                for(colOffset = -1; colOffset <= 1; colOffset++){
                    x_dir = x_dir + input_image[i+rowOffset][j+colOffset] * Gx[1+rowOffset][1+colOffset];
                    y_dir = y_dir + input_image[i+rowOffset][j+colOffset] * Gy[1+rowOffset][1+colOffset];
                }
            }
            edge_weight = ABS(x_dir) + ABS(y_dir);
            output_image[i][j] = edge_weight;
        }
    }
}
```

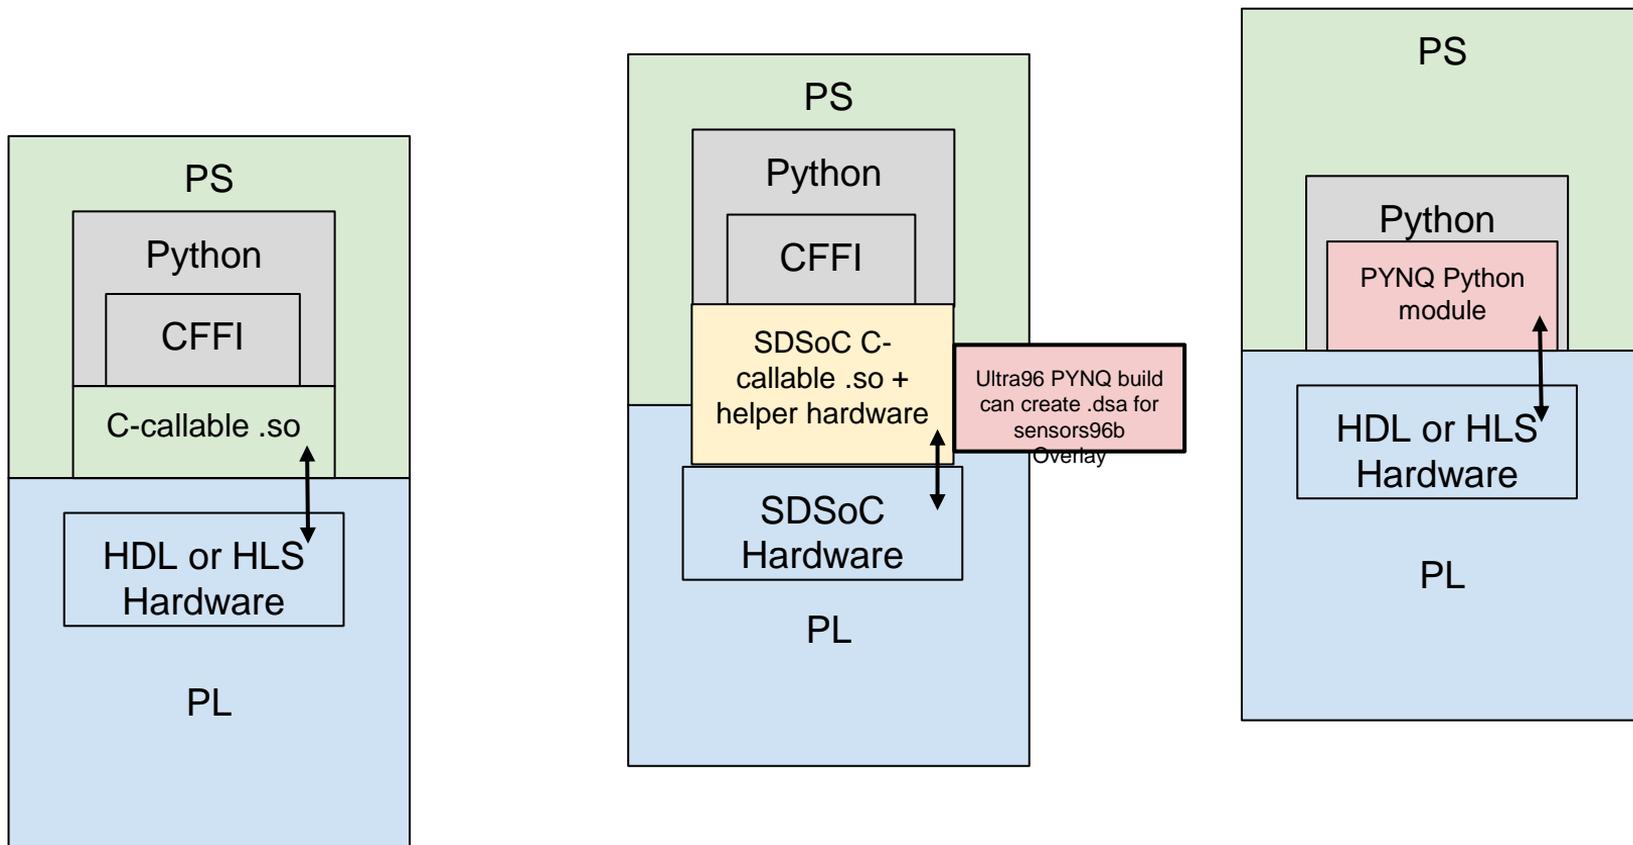

Re-use: some useful Xilinx hardware libraries

- Xilinx Open Computer Vision functions accelerated in hardware
 - SDSoC/HLS C++ Xilinx xfOpenCV library
 - <https://github.com/Xilinx/xfopencv>
- Machine Learning (v2.4 of PYNQ using 2018.3)
 - Xilinx DeePhi DPU, an SDSoC C++ callable AI Inference engine
 - https://www.xilinx.com/support/documentation/user_guides/ug1331-dnndk-sdsoc-ug.pdf
- Xilinx Re-Vision stack (various support for 2018.3, DeePhi for 2018.3)
 - C/C++ callable amalgamation of computer vision and machine learning
 - <https://www.xilinx.com/products/design-tools/embedded-vision-zone.html>

Python data exchange and control of the PL

Python CFFI Example

- Common Foreign Function Interface is a simple and popular means to interface Python with C code
- A c-like method to execute and exchange data with 2 languages whose types are not the same

Simple example:

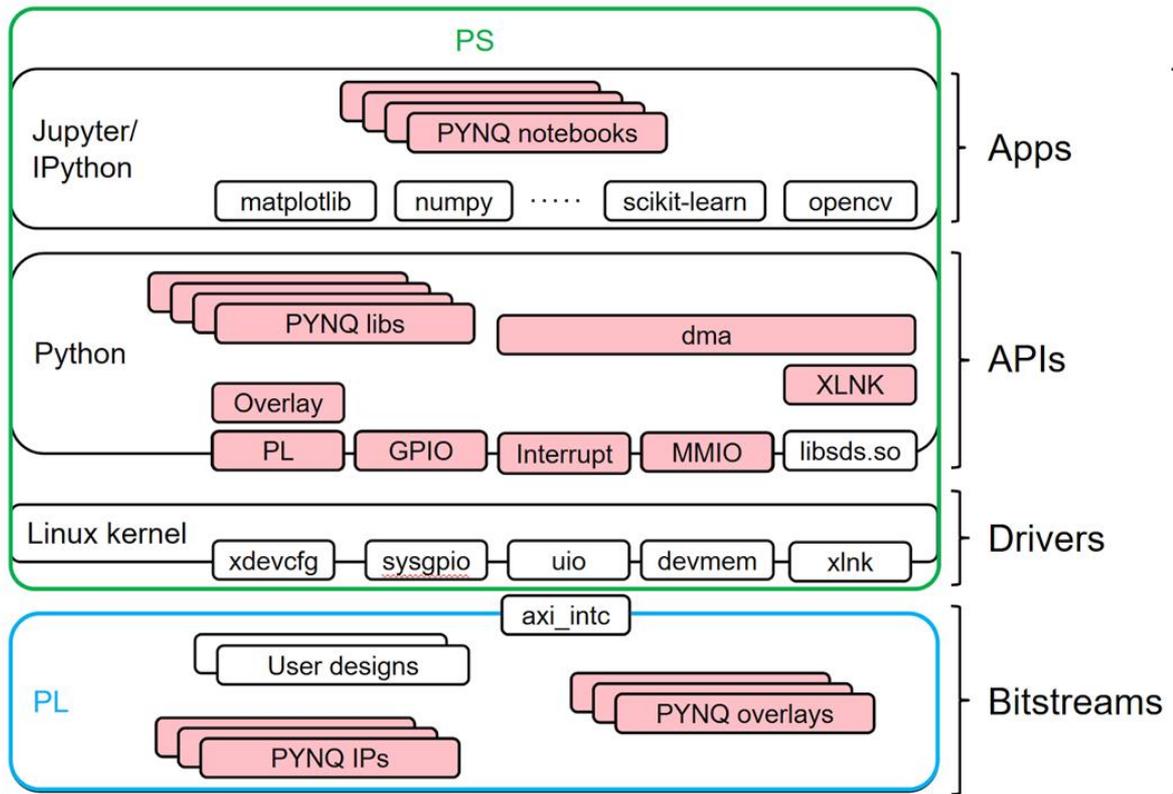

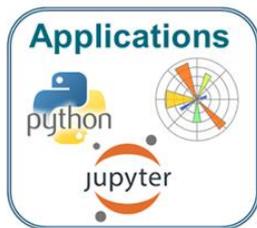

```
from cffi import FFI
ffi = FFI()
ffi.cdef("""
    int main_like(int argv, char *argv[]);
""")
lib = ffi.dlopen("your_library.so")

lib.main_like(2, [ffi.new("char[]", "arg0"),
                 ffi.new("char[]", "arg1")])
```

More info:

<https://cffi.readthedocs.io/en/latest/>

PYNQ Open Source framework

PYNQ™

Ultra96 PYNQ Python module features

Grove board and soon Mikro Elektronika sensor access

Control PL MicroBlaze™ and other IOPs

Classes for creating and auto-creation of Python hardware drivers

Memory management accelerations for numpy

Re-configure and load the PL (load Overlays)

Zero-copy DMA memory transfers

Python control of GPIO, Interrupts, Clocks, SPI, I2C and more

Event driven multi-threaded template classes

Additional IP and much much more...

For precise API details, examples and how-to, Please READ THE MANUAL:

<https://pynq.readthedocs.io/en/v2.4/>

PYNQ Overlays

```
from pynq import Overlay
OL = Overlay("base.bit")
OL.ip_dict
```

Parses to figure out what is in the hardware design

Block design
.hwh or .tcl
file

Loads this file into the PL, does not have to have .hwh or .tcl to use

Bitstream
.bit file

Overlay

SW Analogy

Linker map file

Binary

The Block design .tcl file is created by the Vivado hardware tools with "File > Export > Block Design", .hwh is based on .dsa which are also created with the Vivado tool.

https://pynq.readthedocs.io/en/v1.3/10_creating_overlays.html

Definition of Bitstream file:

A bitstream is a file that contains the programming information for the PL. A Xilinx PL device must be programmed using a specific bitstream in order for it to behave as an embedded hardware platform.

Working example: Ultra96 image resizer

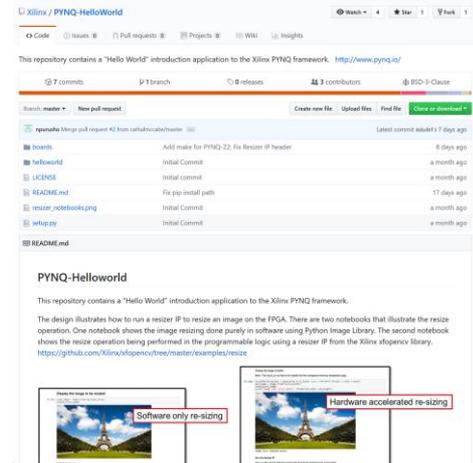

- Python uses PYNQ library to interface Python to the PL Resizer Hardware
- Hardware was designed using C++ HLS and xfOpenCV for image processing
- 2 Notebooks: Resizer_PL.ipynb and Resizer_PS.ipynb
- Hardware resizer round-trip is about 4 times faster than SW only

Fetch Notebook from here:

sudo pip3 install git+[Includes HLS source code \(Please look at this source\):](https://github.com/Xilinx/PYNQ>HelloWorld.git</p></div><div data-bbox=)

[You can study this example and modify it to suit your own purpose.](https://github.com/Xilinx/PYNQ>HelloWorld/tree/master/boards/ip/hls</p></div><div data-bbox=)

You don't have to understand every detail to use it as a template for acceleration

Resizer in Programmable Logic (PL) - Application Notebook

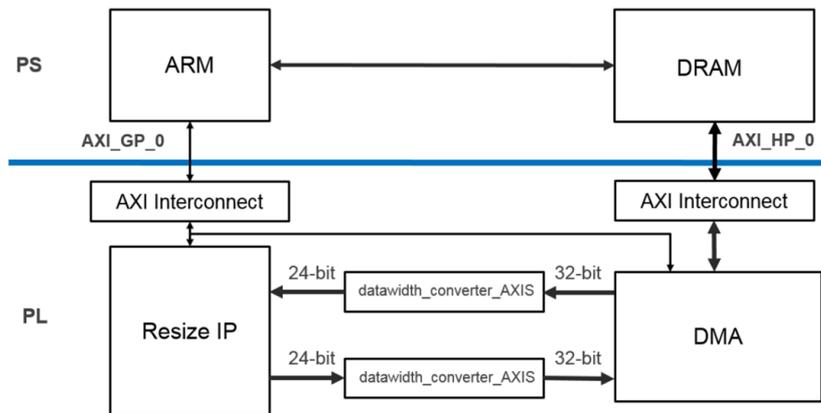

This reference design illustrates how to run a resizer IP on the Programmable Logic (PL) using Jupyter Notebooks and Python

The resizer IP transforms the source image to the size of the destination image. Different types of interpolation techniques can be used in resize function, namely: Nearest-neighbor, Bilinear, and Area interpolation. The type of interpolation can be passed as a parameter to the Python API. https://www.xilinx.com/support/documentation/sw_manuals/xilinx2017_1/ug1233-xilinx-opencv-user-guide.pdf

Contents

- [Image Resizing in Programmable Logic](#)
 - [Import libraries](#)
 - [Download the Resizer IP bitstream](#)
 - [Create an Image object using PIL in SW](#)
 - [Display the image to be resized](#)
 - [Resize in Programmable Logic](#)
 - [References](#)

Block diagram

Import libraries

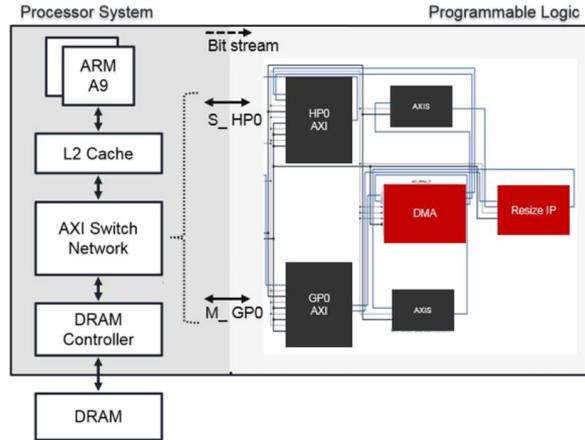

```
In [1]: from PIL import Image
import numpy as np
from IPython.display import display
from pyng import Xlnk
from pyng import Overlay
```

Download the Resize IP bitstream

```
In [2]: resize_design = Overlay("/usr/local/lib/python3.6/dist-packages/helloworld/bitstream/resizer_wrapper.bit")
```

Create DMA and Resizer IP objects

```
In [3]: dma = resize_design.axi_dma_0
resizer = resize_design.resize_accel_0
```

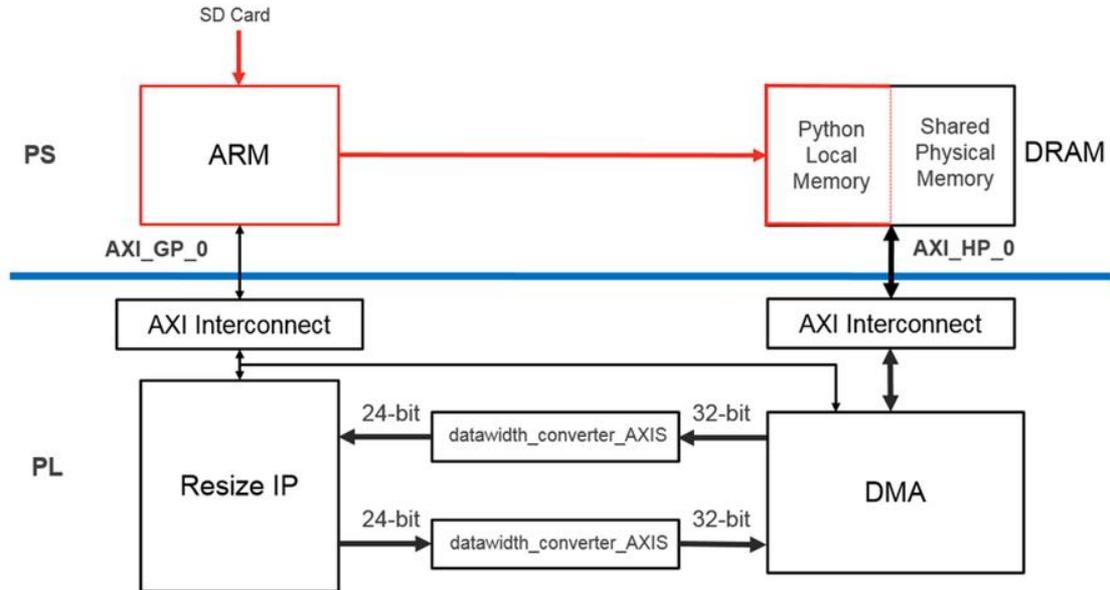

Create an Image object using PIL in SW

Load image from the SD card and create a PIL Image object

```
In [4]: image_path = "./images/iceland.jpg"
original_image = Image.open(image_path)
original_image.load();
```

Create a numpy array of the pixels

```
In [5]: input_array = np.array(original_image)
```

Display the image to be resized

```
In [6]: input_image = Image.fromarray(input_array)
display(input_image)
```

Original image size

```
In [7]: old_width, old_height = original_image.size
print("Image size: {}x{} pixels.".format(old_width, old_height))
Image size: 640x427 pixels.
```

Resize in Programmable Logic

Set resize dimensions

Note:

1. Downscale factor range: 1 to 7 (by design of the resize IP)
2. Max input and output size of Image is 640x360 for this version of resize IP

```
In [8]: resize_factor = 2
new_width, new_height = int(old_width/resize_factor), int(old_height/resize_factor)
```

Allocating memory to process data on PL

Data is provided as contiguous memory blocks.

The size of the buffer depends on the size of the input or output data.

The image dimensions extracted from the read image are used to allocate contiguous memory blocks.

We will call `cma_array()` to perform the allocation.

```
In [9]: xlnk = Xlnk()
in_buffer = xlnk.cma_array(shape=(old_height, old_width, 3), dtype=np.uint8, cacheable=1)
out_buffer = xlnk.cma_array(shape=(new_height, new_width, 3), dtype=np.uint8, cacheable=1)
```

Note: Documentation snippet for `xlnk.cma_array` function:

```
xlnk.cma_array(shape, dtype=<class 'numpy.uint32'>)
```

Get a contiguously allocated numpy array

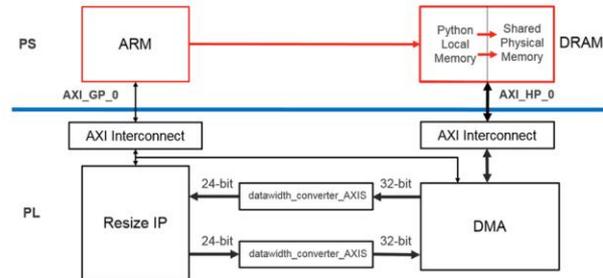

Parameters

shape : int or tuple of int

The dimensions of the array to construct - We use (height, width, depth)

dtype : numpy.dtype or str

The data type to construct - We use 8-bit unsigned int

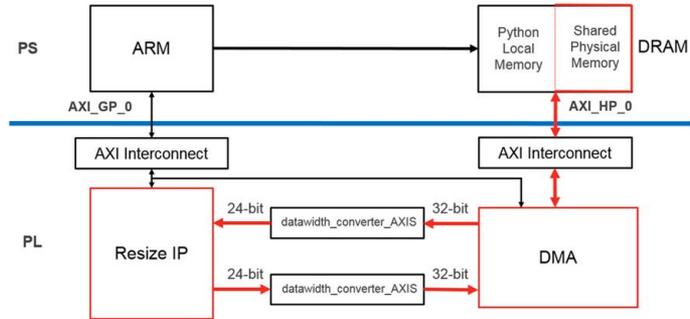

Display the image in buffer

Note : The `input_array` has to be copied into the contiguous memory array(deep copy).

```
In [10]: in_buffer[0:819840] = input_array # in_buffer size = 640*360*3 (height x width x depth)
buf_image = Image.fromarray(in_buffer)
display(buf_image)
print("Image size: {}x{} pixels.".format(old_width, old_height))
```

Run the Resizer IP

Now we will push the data from input buffer through the pipeline to the output buffer.
Providing scalar inputs and running the kernel

```
In [11]: # We setup resizer and DMA IPs using MMIO interface before we stream image data to them
# Write dimensions data to MMIO registers of resizer
resizer.write(0x10, old_height) # 0x10 = src rows
resizer.write(0x18, old_width) # 0x18 = src cols
resizer.write(0x20, new_height) # 0x20 = dst rows
resizer.write(0x28, new_width) # 0x28 = dst cols

def run_kernel():
    dma.sendchannel.transfer(in_buffer)
    dma.recvchannel.transfer(out_buffer)
    resizer.write(0x00, 0x81) # start
    dma.sendchannel.wait()
    dma.recvchannel.wait()

run_kernel()

result = Image.fromarray(out_buffer)
display(result)
print("Resized in Hardware(PL): {}x{} pixels.".format(new_width, new_height))
```

Resized in Hardware(PL): 320x213 pixels.

Timing the resize in PL operation

```
In [12]: # We setup resizer and DMA IPs using MMIO interface before we stream image data to them
# Write dimensions data to MMIO registers of resizer
resizer.write(0x10, old_height) # 0x10 = src rows
resizer.write(0x18, old_width) # 0x18 = src cols
resizer.write(0x20, new_height) # 0x20 = dst rows
resizer.write(0x28, new_width) # 0x28 = dst cols

def run_kernel():
    dma.sendchannel.transfer(in_buffer)
    dma.recvchannel.transfer(out_buffer)
    resizer.write(0x00, 0x81) # start
    dma.sendchannel.wait()
    dma.recvchannel.wait()
```

```
In [13]: %%timeit
run_kernel()

100 loops, best of 3: 3.01 ms per loop
```

Reset Xlnk

```
In [14]: xlnk.xlnk_reset()
```

The End

Appendix / Extra info to help get started with Ultra96 PYNQ v2.4

Additional Information:

Main PYNQ site:

<http://www.pynq.io>

PYNQ distribution source code (build PYNQ for Ultra96 from scratch):

<https://github.com/Xilinx/github> & <https://github.com/Avnet/Ultra96-PYNQ>

You can find the base Overlay and a makefile to create an Ultra96 DSA for 2018.2 SDSoC under [Avnet/Ultra96-PYNQ/sensors96b/](https://github.com/Avnet/Ultra96-PYNQ/tree/master/sensors96b)

Additional design examples and tutorial videos:

<http://www.pynq.io/community.html>

Official Ultra96 PYNQ getting started guide:

<https://ultra96-pynq.readthedocs.io/en/latest/>

Getting started video:

HLS, SDSoC and general PL Intros

- Intro to HLS design:
https://www.xilinx.com/support/documentation/sw_manuals/ug998-vivado-intro-fpga-design-hls.pdf
- Intro to SDSoC design: <https://github.com/Xilinx/SDSoC-Tutorials/tree/master/getting-started-tutorial>
- Avnet Ultra96 SDSoC Platform Tutorial v2018.2:
<http://zedboard.org/support/design/24166/156>
- https://www.xilinx.com/support/documentation/sw_manuals/xilinx2018_2/ug902-vivado-high-level-synthesis.pdf
- <https://www.xilinx.com/support/documentation-navigation/design-hubs/dh0012-vivado-high-level-synthesis-hub.html>
- Older but still useful for HLS: https://github.com/Xilinx/HLx_Examples

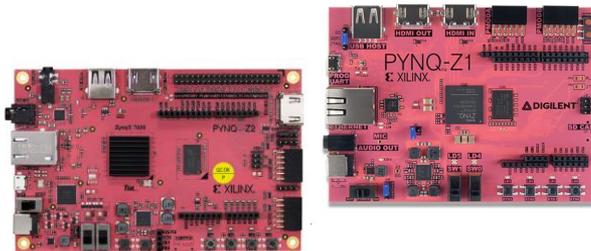

The growing PYNQ family

- Z1, Z2, ZCU104, Ultra96 v1, v2 and RFSoC ZCU111
- PYNQ can be ported to any Zynq or ZynqMP PetaLinux supported platform

ZCU104 with ZU7EV

(Most powerful part with powerful video codec, also the most expensive, least amount of available public PYNQ designs)

PYNQ Z1,Z2 with XC7Z020

(Least inexpensive, has the most existing PYNQ designs but is least powerful of these)

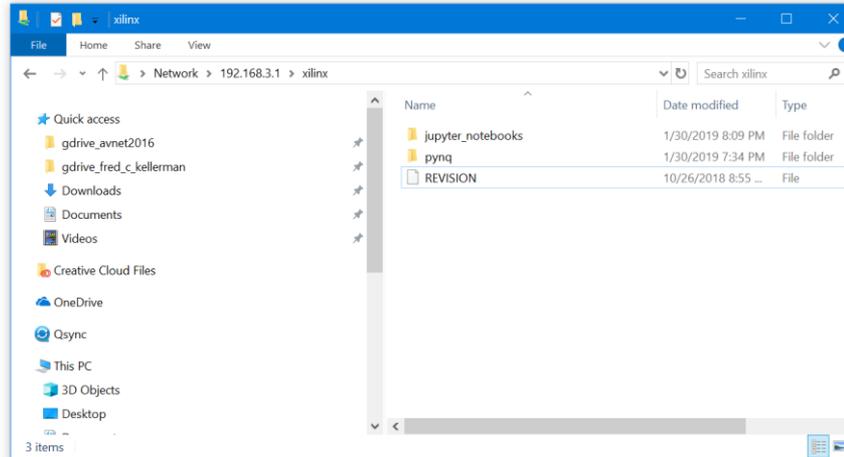

ULTRA96 with ZU3EG

Drag and drop file transfer through USB:

- After boot up, wait about 15-20 seconds, a bit longer the 1st time (see Appendix for more info)
- Open Windows File Explorer (if your PC Admin allows share mapping) open and enter in search bar: \\192.168.3.1\xilinx
- On Linux you must install and configure Samba or cifs
- Simply drag and drop files to transfer them between the Ultra96 file system and the host PC

Password: xilinx

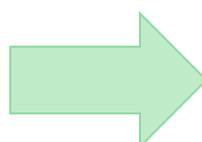

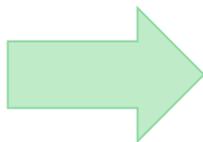

Debian Package Manager

- This PYNQ feature is **fundamentally** different than a typical PetaLinux distribution:
 - It enables installation of features and applications without re-building PetaLinux
- A few examples of 1000's of programs that can be installed:
 - Firefox, Chrome, Python Libraries, C/C++ Libraries, OpenGL, different graphical desktop utilities
- All package manager commands start with 'sudo apt', update, upgrade, install, remove
- How to use it see: <https://wiki.debian.org/DebianPackageManagement>

Internet
Server/Cloud

```

PYNQ booting troubleshooting:

- Wait, it takes about 20 seconds to start up but longer the 1st time, the host PC has to install some drivers for the USB functionality (RNDIS, Samba, Serial COM port)
- On Windows 7 the serial drivers may need to be installed from the PYNQ-USB drive “serial_driver” folder. Windows 10 built-in drivers worked out of the box for me
- You know it is working if a removable drive named “PYNQ-USB” mounts on your host OS, Jupyter Server takes a little longer to start up shortly after.

Troubleshooting:

- Make sure USB cable is working properly
- Make sure your OS is setup to allow removable drives to auto-mount (if not you'll have to figure out how to mount it)
- If no lights on on the board: check power supply and re-press power button
- If **ds6** LED is not green: something is not right with the SD card image or the SD card is incompatible with the Ultra96 (Try again and/or a different card, make sure ≥ 16 GB)

Connecting Ultra96 to the internet:

- For WiFi run Jupyter Notebook: /common/wifi.ipynb
- I prefer a plug-and-play USB to Ethernet adapter and wired LAN
(Anker and TPLINK 1GB USB 3.0 have worked for me, others supported)
- Connections beyond USB IP are setup for automatic DHCP: board will have multiple IP addresses
- 192.168.3.1 is still maintained for USB connections
- Can use either IP address, can also disconnect USB and use just DHCP address
- It is not officially supported but if your PC has admin privileges you may be able to share PC internet access through just the Ultra96 USB cable:
 - Configure host PC appropriately
 - You will have to use dhclient on the Ultra96 to grab new IP.

Test Internet access:

- On the host PC use a serial comms program like TeraTerm and connect it to the PYNQ USB COM device
- Login user: xilinx, password: xilinx
- ping www.avnet.com
- You can obtain the local lan IP by finding the ip list with the ifconfig cmd
- Assuming external firewalls are not impeding your access you should now have full LAN and WAN networking access
- SSH, scp, sftp, ftp, http, pip3 and the apt Debian package manager can now be used to install additional software
- Viva la “apt update, upgrade, install” Enjoy!
